#### Introduction

# Data as the foundation for AI and innovation

Data is the fuel that powers AI technology – and AI technology drives innovation, helping retail and consumer goods organisations to achieve goals such as increased revenue growth, cuttingedge product development, strong customer connections and experiences, and optimised cost management.

To unlock the potential of Al-powered technology, retail and consumer goods organisations must address the barriers to reliable, clean and structured data.

Throughout this e-book, explore how to make sense of your data to leverage Al solutions now and help your business foster greater growth and innovation for years to come.

A retailer's actions in the next two to three years could position it for success in the next 20.

McKinsey & Company<sup>1</sup>

#### Common data challenges

#### Centralisation

Siloed data across systems becomes inaccessible and difficult to harness for insights.

#### Speed

Vast amounts of retail and consumer goods data may be hard to use in real time.

#### Utilisation

After analysing data, businesses can struggle to turn insights into value and opportunity.

#### Chapter 1

# Overcome data fragmentation

Most retail and consumer goods organisations collect data from a variety of sources, including point-of-service systems, e-commerce platforms, supply chains and customer support – to name just a few. Data often comes in a variety of file formats and applications, all of which make it difficult for organisations to efficiently consolidate, analyse and gain actionable insights.

To harness the full potential of your data – for innovation, predicting shopping or product trends, cost optimisation, personalisation and a strong data culture – begin with a thoughtful unification plan.

#### Use case: a supermarket chain reduces waste through unified data

Managing data from multiple shop locations and online platforms can lead to understocking or overstocking. By unifying their data, supermarkets can reduce food waste, optimise stock levels and increase sales by having the right products at the right time.

# Key actions for smarter data management

#### 1. Integrate data sources

Map out data sources and determine the importance of each source.

#### 2. Clean up data

Remove duplicates, standardise formats and address data gaps.

#### 3. Prepare for scalability

Select tools and processes that scale with increases in data volume and complexity.

#### 4. Apply AI for insights

Use AI analytics to derive actionable insights from clean and connected data.

#### Unify your data into a single source of truth

Consolidate your data to enable a 360-degree view of your organisation's operations – as well as your customers' behaviour. By first identifying the key sources of data and then ranking their importance, you can begin to connect your data piece by piece into a unified lake, which is a single repository to house data of all kinds and formats.

Solutions, such as Microsoft Fabric, are designed to help unify your organisation's data in phases while working seamlessly within your existing infrastructure and applications.

Al-powered platforms like Fabric can help you:

- Simplify integration across sources, from sales spreadsheets to product design PDFs, into a unified data lake.
- Work from the same data set across languages and analytics programs.
- Give your sales floor, office, IT and product teams the tools to reduce the cost and effort of data integration and security.
- Gain end-to-end visibility, usage and adoption insights, and industry-leading governance and compliance.

Win-win solutions are those where we are helping our team members and our customers at the same time. Our technological investments into operational efficiency have translated into real, tangible benefits for our shoppers.

Silvio Giorgio

GM of Data & Intelligence, Coles Group

In practice: the value of unified data

# Coles deepens its relationship with shoppers using AI to understand the customer experience and improve efficiency in-store

[Leading supermarket retailer] Coles operates over 1,800 sites, each representing a node at the edge of a complex network. It needed a platform that could support the significant Al workloads of large-format supermarkets.

In partnership with Microsoft, Coles is now shifting from initiating AI solutions to scaling them across its operations. A critical element here is democratising its data, empowering teams across Coles to leverage data, drive intelligent automation and unlock value in unprecedented ways.

# Unlock customer insights and analytics

With a robust strategy for data management and governance, retail and consumer goods organisations can clean, organise and optimise their data. That's when the real, transformative impact of Al-powered applications and advanced analytics programs can come into play – and naturally lead to more growth and innovation.

For example, Microsoft Fabric helps organisations consolidate customer purchase history, browsing patterns, preferences and other information.

This combination of unified data and AI solutions can be used in Microsoft Azure AI to help reveal deeper insights and create more personalised experiences for shoppers – all in a fraction of the time it used to take.

#### Use case: a fashion retailer keeps pace with market trends using advanced analytics

In the fashion industry, retailers need to quickly adapt to the rapid pace of evolving market trends.

All can help forecast these trends, predict customer demand and respond to changes – but only if it has cleaned, unified data to work from.

## Bring new experiences to market and access advanced analytics

With unified data, organisations can use Al technology to get a holistic customer view, enhance personalisation, make better decisions with real-time insights and anticipate customer needs with predictive analytics. Solutions like Azure Al deliver on these capabilities by helping retail and consumer goods organisations:

- Combine in-store purchase data with online browsing history to understand how a customer's behaviour changes across channels.
- Deliver tailored shopping experiences and unlock cross-selling opportunities based on analysis of past purchases, browsing habits or loyalty programme activity.

- Track which products are trending and adjust inventory or marketing strategies on the fly.
- Use past purchase cycles to predict
   when a customer may need a product
   replenishment and apply proactive
   outreach strategies to build loyalty and
   boost repeat purchases.

A unified AI development platform like Azure AI helps bring generative AI solutions to retail markets and empowers retailers to do so confidently, utilising built-in content safety tools that proactively mitigate risk.

With Azure, we've decreased the time it takes to analyse data from eight hours to 10 minutes.

Sedat Çelik

Data Science Manager, Boyner

In practice: using data to accelerate insights

#### **BOYNER**<sup>™</sup>

# Boyner triples e-commerce performance using Azure, boosting customer engagement and conversion

Boyner Group, Türkiye's top fashion retailer, has transformed its technology infrastructure by moving to Microsoft Azure. With enhanced data analytics, Boyner can now draw meaningful insights in 10 minutes instead of eight hours, helping to make informed decisions in real time. With more stable, reliable platforms and treble the performance, Boyner has seen a rise in customer satisfaction, engagement, conversion rate and revenue.

# Optimise operational efficiency and lower costs

By tapping into their data, consumer goods organisations can unlock opportunities to more effectively manage internal equipment, operations, products and personnel.

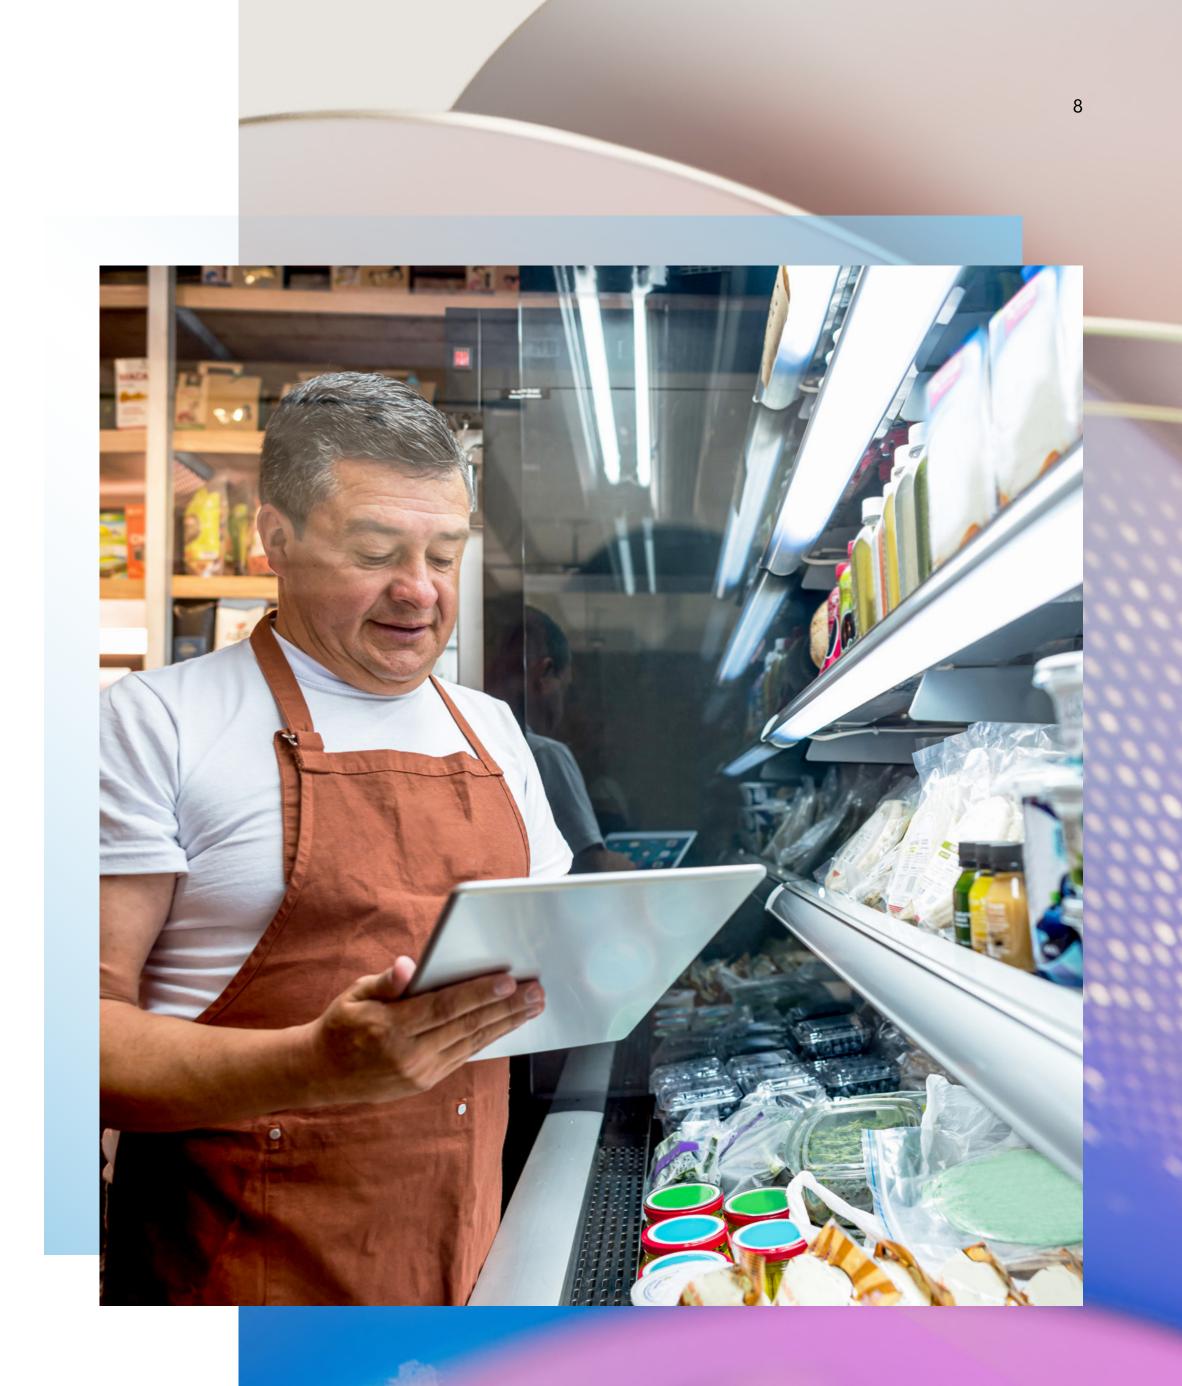

Integrating data from manufacturing, logistics and suppliers into a single system provides a complete view of the supply chain and identifies bottlenecks, inefficiencies and sustainability opportunities.

Further unifying factory and facility data can unlock real-time, intelligent production insights that optimise operations, enable predictive maintenance and improve worker collaboration.

When you unify your data into a single platform that delivers natural language reports, your organisation can better forecast demand, maintain optimal levels of inventory, identify more sustainable solutions and avoid overproduction and shortages.

#### Use case: a consumer goods manufacturer accelerates product development

After integrating data into a unified data lake, a consumer goods organisation can unlock
Al-powered insights to identify inefficiencies in the production cycle, sales and beyond – ultimately
developing products quicker and forecasting consumer demand more accurately, leading to less
waste and fewer stock overages.

#### Improve efficiency throughout the enterprise

Whether you're trying to gain a more holistic view of your retail operation or improve efficiencies in key areas, solutions like Microsoft Fabric can help you:

- Consolidate purchase history, browsing patterns, preferences and other customer data.
- Simplify billing and reduce costs.
- Identify inefficiencies in the productdevelopment process.
- Equip teams to act quickly in response to time-sensitive events, such as new technology or emerging trends.

#### Partner solution

#### **Azure Intelligent App Factory**

Capgemini has built an array of innovative solutions in collaboration with Microsoft, including the <u>Azure Intelligent App Factory</u>. This offering aims to empower consumer goods organisations to scale responsible and sustainable generative AI capabilities for their businesses at speed.

We have seen infrastructure cost reductions up to 40% and performance improvements of around 30%. The automated data ingestion of Fabric has not only reduced the company's manual effort by 25% but also assisted in faster, more accurate data processing and analytics.

Samir Chaudhari

Partner Acceleration Lead, Capgemini

In practice: centralised data modernises operations

## Capgemini harnesses Fabric to deliver efficient, scalable and innovative Al-powered solutions

A United States-based manufacturing company sought the help of Capgemini to modernise their data infrastructure using Fabric. At the time, they were struggling with costly inefficiencies and needed a better way to handle a range of analytics reports from different platforms and data sources.

Capgemini proposed an end-to-end solution that would consolidate the company's disparate data sources into a unified data-as-a-product architecture using Fabric. This Fabric solution centralised the company's data, reduced total cost of ownership and provided a scalable, flexible architecture ready for future growth.

# Enhance customer loyalty through personalisation

When deployed across channels, a personalised customer experience can help inspire brand loyalty, increase sales, propel engagement and lead to more conversions. Al can be a powerful tool to help create those memorable shopping experiences, using predictive analytics to

generate discounts and recommendations.
Whether you're operating online, in a physical shop or both, Microsoft Dynamics 365 offers a suite of solutions – including <u>Customer Insights</u> – that can help you engage with consumers on a more personal level.

of consumers expect companies to deliver personalised interactions, according to McKinsey.<sup>2</sup>

#### Use case: a specialist retailer builds deeper, longer-lasting relationships with customers

Data-driven insights provide a specialist retailer with greater discernment regarding customer preferences and purchasing behaviour, informing more personalised marketing and helping them to save time and reduce costs by smartly managing stock.

# Democratise data so everyone in the organisation can benefit

Democratising data means making it usable and accessible for employees to make better decisions, improve customer experiences and find efficiencies in their work or business operations. This could include, for example, IT teams using predictive customer analytics to improve shopping experiences or cashiers and assistants making inventory decisions in a physical shop. Employees can analyse data using plain language, without programming knowledge, using solutions like Microsoft Fabric and Microsoft 365 Copilot. This can equip the whole team to personalise customer experiences on multiple levels.

## Personalise customer experiences both online and in person

Deliver personalised experiences across retail channels and connect in-store, digital and back-office operations on a unified commerce platform. <u>Dynamics 365 Commerce</u> can help you:

- Enhance customer experiences across shopping channels, exceeding expectations with tailored product selections.
- Increase engagement by empowering customers to decide when, how and where they want to purchase, using their preferred device or channel.

- Centrally manage promotions and discounts across channels using accurate, real-time omnichannel sales and cost data.
- Empower shop employees to foster customer relationships with upsell and cross-sell recommendations, insights, loyalty programmes and intelligent actions.

We recognised the need for an integrated software platform that could grow with our business, provide solutions specific to retailers and eliminate the need for multiple standalone systems. Dynamics 365 offers that and more.

**Rob Meshew** 

CIO, Murdoch's

#### In practice: how democratised data transforms operations

### Murdoch's unifies retail operations and POS with Dynamics 365

Finding the 'Goldilocks' solution that Murdoch's was looking for was easier said than done. The leadership team concluded that Dynamics 365 offered the flexibility, scalability, security and innovation the company needed. Other benefits include:

- Vastly improved finance capabilities with centralised data.
- Accurate inventory on demand.
- Flexible supplier promotions and loyalty programme rewards.
- Better customer experience with improved cashiering.
- New purchasing options for enhanced customer service.

#### Chapter 5

# Empower employees with good data habits

Ongoing data hygiene and trustworthy stewardship can help customer-facing retail organisations to get the most out of their data. But when frontline employees lack the training, literacy and tools to collect, store and manage data safely and effectively, it can lead to missed

opportunities and organisational risk. With the right data use and security training, shop employees can share insights, collaborate and access real-time sales, inventory and customer information through easy-to-use dashboards.

#### Make the most of your data

In addition to training employees, below are some data-management best practices to help employees use and retrieve data quickly and easily.

- Create tags, notes and other metadata about your data's lineage, profile, quality, business context and classification.
- Map and catalogue data assets so users can readily inspect them.
- Equip power users to create reporting dashboards in Microsoft Power BI and gain actionable insights.

#### Use case: a supermarket superstore streamlines inventory management and reduces logistics costs

A supermarket superstore generates stock, product, customer and other reports to provide insights that help shop employees manage inventory and mitigate supply chain disruptions, saving money and helping run the shop more efficiently.

#### Help your employees harness data at scale

Equip your employees with the technology that helps them make the most of data. When choosing a solution, ensure that it supports users with the following capabilities:

- Exploration of customer data in their own words using natural language with Q&A features.
- Ability to connect disparate data sources in the same environment to establish a single source of truth across the retail enterprise.
- Access to real-time data analytics to reduce operational costs and maximise efficiency.

- Easy-to-use AI features that help users discover customer purchasing patterns, create sales and other reports more quickly, provide answers to customer questions and unlock deeper insights for improved personalisation.
- Ability to easily embed and share reports, improving collaboration across retail and consumer goods functions and departments.

Power BI and Copilot in Microsoft Fabric offer all these features – and more – to help your employees uncover and deploy insights more easily.

We were very happy about how easy the tool was to adopt. With little time to study, we were able to quickly adopt the platform. We were reassured by the fact that we had already worked with the entire Microsoft suite and the support we had.

Bruno Vinícius dos Santos

BI and Analytics Manager, Grupo Casas Bahia

In practice: driving agility with data-powered insights

#### **CASAS**BAHIA™

## Grupo Casas Bahia increases data-processing power and becomes the first Microsoft Fabric success story in Latin America

Grupo Casas Bahia, with a long history in Brazilian retail, needed to increase its base capacity to process an immense amount of data and dashboards. With a base of over 12,000 active users, the team needed immediate access to valuable insights during the most important time of the year, enabling agile decision-making across all sectors of the organisation.

An environment for reporting was created in Microsoft Fabric, and in parallel, autoscaling in <a href="Power BI Premium">Power BI Premium</a> was triggered for existing environments, redistributing the workspaces between Microsoft Fabric and Power BI Premium to increase resilience and processing capacity, minimising the risk and impact of potential incidents. The project proved successful and exceeded the expectations of all the teams involved.

#### Chapter 6

# Maintain compliance and navigate data privacy regulations

Protecting data can help retail and consumer goods organisations to avoid the consequences of hackers breaching infrastructure, consumer or product information leaks, phishing and other vulnerabilities that violate customer trust.

Securing customer data is key to:

- Complying with regulatory requirements and privacy laws like the General Data Protection Regulation and the California Consumer Privacy Act.
- Maintaining trust, brand loyalty and a positive relationship with your customer base.

 Avoiding fines, public-relations headaches and other harm that comes from poor data governance.

#### Partner solution

#### **Orca Security**

Orca Security helps organisations protect data throughout their Azure Cloud estate by eliminating silos and empowering security managers to act quickly on risks – all without agents, network scanners, organisational friction or impact on performance.

#### Use case: a consumer goods manufacturer protects their valuable data before their next stage of growth

With data in a unified lake, a consumer goods manufacturer tracks, analyses and protects key information like product formulas and design files, helping them detect and overcome threats before valuable data can be leaked.

#### Protect your data – and customer relationships

In today's retail and consumer goods landscape, trust isn't just valued – it's required. Customers demand personalised, seamless experiences, yet they also expect their data to be handled with the highest level of privacy and care. Establishing a data governance framework is essential for retail and consumer goods organisations to navigate this complex landscape and meet increasing governmental regulations and industry standards.

Below are some of the ways <u>Microsoft Purview</u> can help you secure your data and avoid legal penalties and reputational harm from a breach.

- Understand and govern your data estate, including consumer and product information, by managing assets across your environment.
- Secure your data throughout its lifecycle across apps, clouds and devices.
- Improve your compliance posture by identifying data risks and managing regulatory requirements.
- Add an extra layer of compliance and security over your unified data lake by interoperating with Microsoft Fabric.

We achieved cost reduction, delivery speed, enhanced data governance, security and autonomy for the business areas.

Fernanda Siqueira

IT Executive Manager, Fast Shop

#### Your trusted data and AI partner

Microsoft is committed to security, privacy and compliance across everything we do, and our approach to AI is no different.

15

#### In practice: data governance and AI boost security

## Fast Shop consolidated its data platform on Microsoft Azure and is now ready for the era of Al

[Renowned Brazilian retail chain] Fast Shop required an upgrade of its data platform in order to improve decision-making and create the foundations for the adoption of Al. The project involved data cleaning and optimisation, reducing by half – a little over 50% – the number of load and transformation objects, leading to an improvement in governance and security.

They created a self-service culture of access to data, eliminated delays, reduced costs and increased leadership satisfaction with data, while providing more agility in reporting. This entire maturity process provided the ideal environment within the retailer's data platform for the adoption of AI solutions, which are expected to help Fast Shop in strengthening its relationship with customers, leading to an enhanced purchase experience in the chain's channels.

#### Closing

# Realise opportunities for data-driven growth

Combining clean, unified data with a robust AI strategy unlocks enormous potential for growth and innovation. **Here's how to do it:** 

- Unify your data. Build a single source of truth to securely derive insights from data across your organisation, from physical and digital storefronts to warehouses and production facilities.
- Streamline operations with data-derived insights. Optimise resources, accurately gauge inventory, reduce costs and uncover efficiencies throughout your operation with end-to-end visibility of your entire data estate.
- Personalise your relationship with customers. Harness customer data to build brand loyalty and personalise shopping experiences.
- Equip your teams with the data they need. Help your retail and production teams unlock insights with natural language prompts and other easy-to-use AI features.

### \$660 billion USD

is the estimated annual revenue potential for the retail and consumer packaged goods industry by increasing productivity with generative AI, according to McKinsey.<sup>3</sup>

#### Ready to begin?

- Register for a no-cost <u>Microsoft Fabric</u> trial to organise and unify your data and begin unlocking its true potential.
- Explore Microsoft Cloud for Retail for ways to unlock value and connect your customers, your people and your data.
- Meet consumer demands, build brand loyalty and drive sustainable growth with <u>Microsoft services for consumer goods</u>.
